

B.2 What was accomplished under these goals?

1. To continue to provide high quality healthcare to breeding and research nonhuman primates through the preventive medicine programs, effective quarantine practices, and the provision of routine clinical, surgical, neonatal and emergency care. From the time in this reporting period where data is available (5/1/19-1/1/20) veterinary services opened a total of 4,380 clinical cases, including treatment of spontaneous disease as well management of research-related conditions.

2. To enhance the biosecurity of our nonhuman primate colonies and pursue infection control procedures and practices to eliminate potential pathogens currently present including SRV, MRSA and Valley Fever. Animals are tested by serology and PCR every six months, and there have been no positive PCR tests for SRV. We have identified novel simian endogenous retroviruses that are
